

Your Labs Tell a Story

September was a busy month at DRIPwoRX.

Back-to-school season also means the return of the “freshman flu,” and so far, it has shown no signs of slowing down. As our schedules become busier and cold and flu season approaches, this is an important time to understand what your body may need to perform, recover, and stay well.

This month, our focus is on Wellness Panels, Iron Panels, and the valuable insights blood work can provide. Did you know at DRIPwoRX, we offer Full Wellness Panel labs from **\$149**, Iron Panel from **\$99** and most single lab test start at **\$29** and the best part is any Lab services are HSA/FSA approved.

● A better view of your wellness

Blood work gives us a window into what may be happening beneath the surface. You can feel relatively well while still having nutritional deficiencies or trends that may affect your energy, recovery, immune function, athletic performance, and long-term wellness.

Laboratory results do more than produce numbers on a page. They help your healthcare provider better understand your individual needs and determine where nutrition, lifestyle changes, supplementation, or clinically guided IV therapy may offer support.

Rather than taking a one-size-fits-all approach, blood work helps make your wellness journey more informed and personalized.

● Know your numbers

Ask your Primary Care Provider—or whoever performs your routine laboratory testing—whether it is appropriate to check your:

Vitamin D

Complete Iron Panel

Vitamin B12

You may especially want to review these levels if you are:

- Preparing for surgery
- Experiencing persistent fatigue or low energy
- Focused on athletic performance and recovery
- Working to stay at your best during cold and flu season
- Investing in your long-term wellness and longevity

Knowing your numbers allows you to have a more meaningful conversation with your healthcare provider and make informed decisions about your next steps.

FEATURED SERVICE

Low-Dose Iron Infusion

Iron is essential for producing healthy red blood cells and transporting oxygen throughout the body. When iron stores are low, people may experience fatigue, weakness, reduced exercise tolerance, headaches, difficulty concentrating, shortness of breath, or restless legs.

DRIPwoRX offers medically supervised, low-dose IV iron repletion for appropriate clients with documented iron deficiency—with or without anemia.

Low-dose iron infusion may be considered for individuals who:

- Cannot tolerate oral iron
- Have chronic blood loss or heavy menstrual bleeding
- Are preparing for surgery and have documented iron deficiency
- Have difficulty absorbing oral iron
- Have depleted iron stores associated with endurance training
- Have fatigue or restless legs with documented low ferritin

Our typical protocol uses small, individualized doses administered in a calm clinical setting. The specific iron product, dose, and number of sessions are determined by the supervising provider based on laboratory screening and total repletion needs.

Recent iron studies, a complete blood count, and appropriate metabolic testing are required. IV iron therapy is prescribed and supervised by a licensed provider and is not appropriate when iron studies are normal.

• Jump to the front of the wellness line

Wellness is not only about responding after you receive a diagnosis or begin feeling unwell. It is about understanding your body, identifying potential needs, and taking informed steps before seasonal illness, surgery, travel, or a demanding schedule begins to take its toll.

Jump to the front of the wellness line with DRIPwoRX Signature IV Therapies—personalized according to your health history, wellness goals, provider consultation, and available laboratory insights.
